SOV/122-58-5-2/26

AUTHORS: Fedyakin, R.V. and Chesnokov, V.A., Candidates of Technical Sciences

TITLE: The Design of Gear Transmissions of the M.L. Novikov Type
(Raschet zubchatoy peredachi M.L. Novikova)

PERIODICAL: Vestnik Mashinostroyeniya, 1958, Nr 5,
pp 11 - 19 (USSR).

ABSTRACT: The sequence of design of the new Novikov tooth form is discussed. The tooth profile consists of circular arcs but the tooth as a whole has a complex shape. The shape and load distribution of the contact area are assumed. Usually, a truncated elliptical area is the result of short teeth. A circular distribution over the middle portion of the tooth width is said to be typical. The case of point contact with an elliptical contact area is also considered. Geometric relations derived in the two authors' previous paper (Vestnik Mashinostroyeniya, 1958, Nr 4) are re-capitulated. The radii of curvature of the pinion and wheel teeth are computed. Linear contact along the tooth height gives the best load capacity. The contact stresses for this case are computed by means of the Hertz theory. Formulae are given for determining the radii of the equivalent cylinders. The calculation yields Card1/3 a "reduced" radius and a "reduced" length of the equivalent

SOV/122-58-5-2/26

The Design of Gear Transmission of the M.L. Novikov Type

cylinder whose product, multiplied by the square of the permissible contact stress and by a numerical factor, gives the limiting tangential force transmitted by the tooth. The permissible contact stress is proportional to the Brinell hardness number and to the sixth root of the reciprocal number of load cycles. Gears so designed and tested under operating conditions are claimed to have exceeded the capacity of involute gears of the same size by a factor of 3 at an average peripheral speed of 12 m/sec. Gears running up to 60 m/sec were tested at the Nikolayevskiy mashinostroitel'nyy zavod (Nikolayevsk Engineering Works) showing a similar superiority. The helix angle has a substantial effect. The best results were obtained with a helix angle of about 15°. The design of the teeth for bending strength is based on a formula by which the bending stress is proportional to the tangential force and the tooth height and inversely proportional to the square of the root cross-section of the tooth. This follows from the application of a load which is uniformly distributed over the height of the tooth and elliptically over the length. Teeth of equal safety against bending and contact stresses are obtained by changes of profile but not by changes in module.

Card2/3

SOV/122-58-5-2/26

'The Design of Gear Transmission of the M.L. Nivokov Type

It is thought that at least three different basic profiles will be required to make full use of the potentialities of the new tooth shape. Details of bending strength analysis are given for convex and concave teeth. A safety factor of 2.5 is recommended. A very high strength of the new tooth form is claimed, supported by practical tests. The original teeth with both sides of the profile consisting of concentric circular arcs have excessive strength. After laboratory experiments assisted by strain gauge measurements, the appropriate proportions were established for the tooth thickness and the root fillet radius. The tooth strength is determined mainly by the value of the profile shift, by the pressure angle and by the helix angle. A shift of 0.05 - 0.20, a pressure angle of 20 - 30° and a helix angle of about 12° appear to give best results. With the basic parameters chosen, the geometric design of the tooth profile can be carried out. A detailed instruction and sequence of steps are given in the paper. There are 7 figures and 5 Soviet references.

TITLE: Rectangular-pulse current generator with a silicon-controlled rectifier

SOURCE: Pribory i tekhnika eksperimenta, no. 6, 1966, 196-198

TOPIC TAGS: pulse generator, pulse signal

ABSTRACT: A pulse generator which uses a silicon-controlled rectifier (SCR) is described (see Fig. 1). A triggering signal amplified by $T_6 - T_7$, causes the SCR to conduct. Simultaneously, the triggering signal amplified by T_1 and T_4 causes thyratron (T_5) to conduct and capacitor C is discharged through it. When the voltage on capacitor C reaches the value $E_1 - \Delta U_t$ (ΔU_t is a voltage drop across the thyratron in the open state), the thyratron turns off. After the time interval which determines the duration of the pulse, a negative pulse is applied to the circuit consisting of $1/2 T_1$, T_2 , T_3 . After being amplified by $1/2 T_1$ and T_2 , this pulse causes the thyratron to conduct. The voltage on the plate of T_3 and, consequently, that on the plate of the SCR decreases. The SCR is thereby cut off,

TITLE: A roller bearing. Class 47, No. 188231 [announced by Military Aviation Engineering Order of Lenin Krasnoznamennaya Academy im. Prof. N. Ye. Zhukovskiy (Voyenno-vozdushnaya inzhenernaya ordena Lenina Krasnoznamennaya Akademiya)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 21, 1966, 188

TOPIC TAGS: roller bearing, machine accessory, bearing race

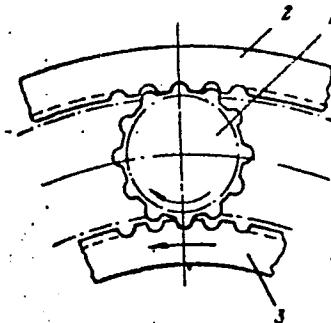

ABSTRACT: This Author Certificate presents a roller bearing with grooved working surfaces of rings and rollers. To increase its load-bearing capacity and to diminish the noise it produces, the grooved working surfaces of rings and rollers are concave-convex and are identical in the rings and in the rollers (see Fig. 1). These grooves in the surfaces may be disposed in a herringbone pattern, may be curvilinear or helical.

✓ Physicochemical analysis of the ternary system, acetic acid-phenylacetic acid. I. M. Bokhovkin and V. P. Cheshnikov (Petroz. Inst., Archangel), *Zhur. Osnovcheskoi Khimii*, 23, No. 14 (1955). No interaction was found in the binary system of $\text{CO}(\text{NH}_2)_2$ and $\text{PhCH}_2\text{CO}_2\text{H}$ by thermal-analysis methods. The latter applied to the ternary system showed that the largest area of crystallization is that of $\text{CO}(\text{NH}_2)_2$, followed by that of $\text{PhCH}_2\text{CO}_2\text{H}$, and finally of the compound $\text{CO}(\text{NH}_2)_2\text{AcOH}$, at. 30°; AcOH occupies the smallest of crystallization areas on the diagram. The results are shown graphically. The system has 2 ternary eutectics: one 12° with 35 mole % AcOH, 35 mole % $\text{PhCH}_2\text{CO}_2\text{H}$, and 30 mole % $\text{CO}(\text{NH}_2)_2$, and the other at -3° with 8 mole % $\text{CO}(\text{NH}_2)_2$, 74 mole % AcOH, and 18 mole % $\text{PhCH}_2\text{CO}_2\text{H}$. Curves of compn. vs. cond., viscosity, and d. in the binary systems $\text{CO}(\text{NH}_2)_2$ - $\text{PhCH}_2\text{CO}_2\text{H}$ and AcOH - $\text{PhCH}_2\text{CO}_2\text{H}$ were almost rectilinear and indicated the lack of chem. interaction. TITLE: Improvement of the stability of synchrotron parameters by stabilizing the power supply of the electromagnet

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 31, no. 5, 1961, 627-629

TEXT: It is noted that the instabilities of the intensity and energy of gamma emission of a synchrotron are caused chiefly by the varying voltage of the power source feeding the electromagnet. The advantages of a power source independent of the industrial power system are mentioned, and the difficulties associated with the stabilization of alternating currents are discussed. The current stabilizer shown in Fig. 1 is designed for the power source of a synchrotron. Stabilization is done in such a way that the positive feedback will be proportional to the amplitude of the pick-up signal which is determined by the amount and sign of voltage variation. The stability of gamma bremsstrahlung could be increased by the use of such a stabilizer (Fig. 2) which had a stabilization coefficient of 16. The voltage fluctuations of the mains could be lowered from 10 to 0.5%.

Card 1/4

22788

S/057/61/031/005/019/020
B104/B205

Improvement of the stability...

Thus, it was also possible to improve the stability of the final electron energy and to reduce the variation in electron energy occurring with a change of the supply voltage by 10% from 0.8% to 0.05% with the use of the stabilizer described here. The variation in the final energy of the particles, caused by fluctuations in the mains, could be lowered considerably. There are 2 figures and 2 Soviet-bloc references.

TITLE: Calibrating large scintillation crystals

SOURCE: Pribory i tekhnika eksperimenta, no. 1, 1965, 78-81

TOPIC TAGS: scintillation crystal, scintillation crystal calibration

ABSTRACT: The flash caused by single-energy electrons isolated by a magnetic field is used for calibration of large scintillation crystals in an array shown in Enclosure 1. The electrons set up by gamma-quanta in lead are directed by a magnetic lens system and focused on the crystal. By varying the field strength of the lattice system the electrons can be directed along the selected trajectory and the curves photomultiplier-pulse-amplitude vs. electron energy (20-100 Mev) can be obtained. A standard cosmic mu-meson spectrum was used for comparing the calibration of a crystal with the calibration of other similar crystals. Results of

AUTHOR: Chesnokov, V. L.

TITLE: Hydrofoil cruising cutter with glass-plastic hull

PERIODICAL: Byulleten' tekhniko-ekonomicheskoy informatsii, no. 2, 1962, 74-75

TEXT: The author reports on a hydrofoil boat with glass-plastic hull, built at the "Krasnoye Sormovo" Plant and intended for pleasure cruises, tourism and official trips on rivers, lakes, reservoirs and the coastal waters of inner seas. The stability of the cutter ensures safe sailing on waves of 2 m height. The boat's hull consists of two sections - hull and deck. The sections are molded in wooden dies. The board and deck sheathing is 3 - 4 mm, that of the bilge is 5 - 6 mm thick. The necessary sheathing thickness is obtained by adequate numbers of glassfiber layers which are impregnated by polyester resins. Corrugated bulkheads, ribs and keelsons are formed in special dies, the ribs and keelsons having a T-section. The hull is divided into four compartments by three watertight bulkheads. The hydrofoil structure of the cutter consists of two carrying foils and an additional bow foil. The foils are welded structures made of 1X18H9T (1Kh18N9T) stainless steel. A converted M-13 four-stroke carburetor

Hydrofoil cruising cutter with glass-plastic hull

engine, with which the "Chayka" cars are fitted, is used as main engine. The engine has a power of 170 HP, is started by an electric starter and is mounted on rubber shock absorbers. The engine operation can be controlled by instruments on the instrument panel. A d-c generator of the FC -101-OC (GS-101-08) type and a 6CT-68-EM (6St-68-EM) storage-battery are used as electric power sources. The following technical data of the cutter are given: displacement (full) - 1.95 tons; overall draught (on the screw) during navigation - 0.85 m; draught when running on hydrofoils - 0.55 m; maximum cruising speed at full displacement - 100 km/hour; number of seats - 6; overall dimensions (length x width x height) - 8.42 x 2.44 x 0.96 m. During test runs in 1961 on calm waters a speed of 100 km/hour was reached. The good maneuverability of the cutter ensures safe sailing at the normal service speed (85 - 90 km/hour) on winding water ways. There is 1 figure.

The experiments were conducted in a calorimeter described in earlier studies by the authors. The experimental procedure is described in the source. The reacted solutions were analyzed for F^- , Cl^- and NH_4^+ ions and for separated iodine. The experimental results and the calculated heats of the reactions of NF_2Cl with KI solutions are given in Table 1. The heat of formation of gaseous NF_2Cl was calculated from a thermochemical equation which took into account the heats of formation and solution of the substances involved. The respective heat values were taken from reference books or earlier studies. The missing value of the heat of solution of KCl in KI solution was determined experimentally for a neutral 15% KI solution (Table 2). The standard heat of formation of gaseous NF_2Cl was found to be

Table 2.

AUTHOR: Tyagunov, G. A.

DATE: 30/09/97-2-19/24

TITLE: Scientific Conference of the MPI (Moscow Institute of Physics and Technology) on the

SUBJECT: Atomnaya nauchno-tekhnicheskaya konferentsiya MPI (Moscow Institute of Physics and Technology) on the

ABSTRACT: The early scientific meeting was held from 17 April to 15 May 1959 in the Moscow Institute of Physics and Technology. More than 600 participants from 100 different institutes attended the 2 plenary and 16 sectional conferences. A total of 148 lectures were held. The following

conferences are especially mentioned: 1. K. Zamorodny on the thermal-nuclear excitation; F. G. Jager on the physical foundations of molecular generators and amplifiers; A. I. Lepremont on the construction of a fast reactor; L. I. Tsvetanov on the theory of the peripheral collision of atoms and nucleons; A. B. Mordvin on superconductivity and momentum of inertia of the nucleus; A. S. Kondratenko on some electromagnetic gravity wave; V. I. Gor'kov on levels which are excited within the nucleus shell; and methods of calculating the basic potential and local problems on the analysis of the possible experiments for the detection of the appearance of the meson-meson system. I. I. Dzhigal'ev on the spectrum of liquid metal crystallization; A. P. Krugov on pressure (8000-10000 atm) and an instrument for measuring the absorption curve; L. V. Lyapidevskiy and O. V. Chashnik on new application possibilities for the electron acceleration chamber; A. V. Shchelkov on calculation methods for linear electron accelerators with oscillatory waves; P. A. Smirnov, A. B. Mordvin and A. V. Zabotin on the theory of the electron capture under certain conditions of the acceleration; A. G. Prostyan on optimum wave length for a generator; S. P. Semenov and G. A. Tyagunov on magnetic focusing; A. N. Korobkin, Yu. A. Tikhonov, P. A. Polubarnov, N. N. Kostylev and I. V. Kuznetsov on the 3 day linear accelerators of the MPI; and others.

Reports on excitation of the electron movement in the gap between the electron with consideration of the scattering field; A. A. Kravov on impulse method for measuring the heat conductivity of liquids and the theory of this method; V. A. Shabotnikov on the electron gun; V. A. Chilin on heat transmission to the electron gun which flows in circular motion; R. V. Slobodchikov on heat transmission to electron gun; L. M. Kozulin on special conditions of cooling; V. A. Kozulin on the impulse technique; D. D. Polubarnov on calculation methods and construction of an impulse transformer; for instruments with semi-conductor elements; I. A. Chelishev on the characteristics of the iodine method of refining niobium and characteristics of the metal obtained; R. I. Gavrilov and G. G. Krabova on examination of the micro-distribution of carbon, titanium, iron and other elements in niobium and its silicon by use of neutron radiography; G. P. Fedorenko on determination of the sublimation heat of strontium and niobium by using radioactive indicators and G. B. Fedorenko and I. A. Chelishev on determination of diffusion coefficients of chrome, nickel, iron and chromium in steel. The literature for all these lectures will be published by the MPI in a separate.

PLATE 2 BOOK INFORMATION
 Moscow: Instituteo-Fizicheskiy Institut
 Vakontroll: Izobrniy stat' (Accelerators: Collection of Articles)
 Moscow, 1960. 163 p. Errata slip inserted. 3,600
 copies printed.

Sponsoring Agency: Ministerstvo spetsial'nogo sredstva i stranogo spetsial'nogo
 obnaruzheniya Rossii.

Ed. (Title page): G. A. Tregunov, Doctor of Technical Sciences.
 Professor; Tech. Ed.: G. N. Popov.

Coverage: The book contains articles by staff members of the Department of Electrophysical Investigations of the FIFI. These include: "Investigation of theoretical and experimental aspects of linear electron accelerators"; "Investigation of linear electron accelerators - betatrons and cyclotrons"; one article deals with ion sources for cyclotrons. The theoretical paper on linear electron accelerators are a continuation of a similar research paper published in the collection of articles "Dinamika uderzhitel'nykh ustroystv" (First edition, 1959) on the dynamics of particles in these machines. The theoretical part of the article contains a mathematical solution of the problem of particle motion taking into account the collective interaction of particles in the beam and the inductive properties of that beam at the moment of onset and break. A number of experimental investigations dealt with measurements at and with electron accelerators and certain components, while a special study is concerned with the design of the accelerator (collimator) proposed a few years ago by one of the co-authors of the article in question. No personnel are mentioned. References accompany most of the articles.

TITLE: Standard heat of formation of chlorodifluoramine

1966,

SOURCE: Zhurnal fizicheskoy khimii, v. 40, no. 9, 2101-2104

TOPIC TAGS: chlorodifluoramine, heat of formation, potassium iodide solution, gaseous chlorodifluoramine, liquid chlorodifluoramine, FLUORINE COMPOUND, CHLORINE COMPOUND

ABSTRACT: The standard heat of formation of chlorodifluoramine has been determined from its reaction with an aqueous solution of potassium iodide

This reaction proceeds in several steps. Selection of proper [unspecified] pH of the solution and contact time of NF_2Cl with the solution reduced reaction 1 to the reaction

NF_2Cl used in the experiments contained, in addition to N_2 and N_2O , 1 to 7% N_2F_2 whose presence caused in the calorimeter the additional reaction

The experiments were conducted in a calorimeter described in earlier studies by the authors. The experimental procedure is described in the source. The reacted solutions were analyzed for F^- , Cl^- and NH_4^+ ions and for separated iodine. The experimental results and the calculated heats of the reactions of NF_2Cl with KI solutions are given in Table 1. The heat of formation of gaseous NF_2Cl was calculated from a thermochemical equation which took into account the heats of formation and solution of the substances involved. The respective heat values were taken from reference books or earlier studies. The missing value of the heat of solution of KCl in KI solution was determined experimentally for a neutral 15% KI solution (Table 2). The standard heat of formation of gaseous NF_2Cl was found to be

Table 2.

TITLE: A method for making an autoelectronic pellicular electrode system. Class 21,
No. 174727

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 18, 1965, 56

TOPIC TAGS: electrode, field emission, thin film circuit, dielectric layer

ABSTRACT: This Author Certificate presents a method for preparing an autoelectronic pellicular electrode system. The system consists of a cathode and an extraction electrode. Conducting films of these electrodes are vaporized on a dielectric backing. To simplify the process of making an electrode system that is divided by an insulating space, a film is vaporized onto the backing of the cathode and extraction electrode simultaneously at an acute angle from a point source. The source is located on the side of the extraction electrode.

Problems Concerning Philosophy of Modern Natural Science (Filosofskie voprosy sovremennoego yestestvoznaniya).

PERIODICAL:

Vestnik Akademii nauk SSSR, 1959, Nr 1, pp 132-158 (USSR)

ABSTRACT:

At the end of October last year an All-Union conference took place which dealt with these problems. The conference had been convened by the Akademiya nauk (Academy of Sciences) and the Ministerstvo vysshego obrazovaniya SSSR (Ministry of Higher Education of the USSR). More than 600 well-known experts in the spheres of sciences and philosophy took part, among them Academicians and Corresponding Members, Academy of Sciences, USSR, representatives of the Academies of the Union Republics and Branch Academies as well as scientists from scientific research institutes and universities. Scientific representatives from Bulgaria, Rumania, Germany, Hungary and Czechoslovakia were guests. It was the aim of the conference to unite the creative powers of Soviet philosophers and scientists for the purpose of a dialectic-materialistic generalization of the achievements of modern science and for raising its level which is intended to contribute towards a solution of the most

Card 1/4

SOV/30-59-1-47/57

Problems Concerning Philosophy of Modern Natural Science

dealt with cybernetics and natural science.

V. A. Ambartsumyan, Academician, spoke about some methodical problems of cosmogony.

V. A. Engel'gardt, Academician, and G. M. Frank, Corresponding Member, AMS USSR reported on the role of physics and chemistry in investigating biological problems.

A. I. Oparin, Academician spoke about the formation of life in the light of the achievements of modern natural science.

N. I. Grashchenkov's report dealt with the Lenin's reflex theory and modern physiology of the sensual organs.

A. Z. Zhmudskiy opposed the opinion expressed by M. E. Omel'-yanovskiy who said that in the capitalist countries a crisis in physics is approaching.

D. I. Blokhintsev, Ya. Terletskiy, D. D. Ivanenko, T. A. Lebedev, E. Ya. Kol'man, V. V. Perfil'yev took part in the discussion of the report delivered by V. A. Fok.

M. F. Shirokov opposed A. D. Aleksandrov's view concerning the general theory of relativity. V. I. Sviderskiy, A. L. Zel'manov, A. A. Tyapkin also took part in the discussion of A. D. Aleksandrov's report.

G. I. Naan, A. L. Zel'manov took part in the discussion of the

Card 3/4

SOV/30-59-1-47/57

Problems Concerning Philosophy of Modern Science

report given by V. A. Ambartsumyan.

G. V. Nikol'skiy, P. K. Anokhin, G. V. Platonov took part in the discussion of the report by S. L. Sobolev and A. A. Lyapunov.

V. L. Ryzhkov, N. M. Sisakyan and I. Panchev (Bulgaria) participated in the discussion of the report delivered by V. A. Engel'gardt and G. M. Frank.

Yu. P. Frolov, V. N. Kolbanovskiy, S. L. Rubinshteyn participated at the discussion of the report by N. I. Grashchenkov.

P. N. Fedoseyev, Corresponding Member, Academy of Sciences, USSR concluded the conference. The results obtained at the conference were discussed at a joint meeting of the Prezidium Akademii nauk SSSR (Presidium of the AS USSR) and the Kollegiya Ministerstva vysshego obrazovaniya SSSR (Board of the Ministry of Higher Education of the USSR) on January 2, 1959. Measures were outlined for the intensification of working out philosophical problems of modern science. There is 1 Soviet reference.

TITLE: Philosophical Problems of Present Natural Science
(Filosofskiye problemy sovremennoego yestestvoznaniya)

PERIODICAL: Priroda, 1959, Nr 4, pp 53-58 (USSR)

ABSTRACT: The Presidium of the Akademiya nauk SSSR (AS USSR) and the Ministerstvo vysshego obrazovaniya SSSR (USSR Ministry of Higher Education) convened an All-Union Conference on Philosophical Problems in Natural Science, which took place in Moscow from 21 to 25 October 1958. Apart from leading Soviet scientists, representatives of East-block countries participated as guests. The opening speeches were made by Academician A.N. Nesmeyanov, President of the AS USSR, and by Academician K.V. Ostrovityanov, Head of the Orgkomitet Soveshchaniya (Organization Committee of the Conference). The conference heard the following reports: Academician M.B. Mitin on the permanent importance of Lenin's "Materialism"

Card 1/5

Philosophical Problems of Present Natural Science

SOV/26-59-4-12/43

and Empiro-Criticism" for present natural science; M.E. Omel'yanovskiy, Academician of the AS UkrSSR, on the great importance of Lenin's philosophical inheritance for modern physics; B.M. Kedrov, Doctor of Philosophical Sciences, on the correlation of movement forms of matter in nature; V.A. Fok, on theoretical problems of quantum mechanics, mentioning in this connection A.D. Aleksandrov, N. Bor, D.I. Blokhintsev, L. de Broglie, D. Bon and Zh. Vizh'ye; A.D. Aleksandrov, Corresponding Member AS USSR, on problems of the theory of relativity; S.L. Sobolev, Academician, and Professor A.A. Lyapunov on the practical side of cybernetics; Academician V.A. Ambartsumyan on qualitative differences in the structure of a cosmic system of various order; Academician V.A. Engel'gardt and G.M. Frank, Corresponding Member of the AMN USSR, on problems of physical, chemical and biological movement forms of matter; Academician A.I. Oparin on

TITLE: Thermoelectric Generator for Power Supply of Radio Receivers

PERIODICAL: Tyazh. prom-st' Podmoskov'ya, 1958, No. 1, pp. 50-53

TEXT: Thermoelectric heat generator T3TK-2-2 (TEGK-2-2) has 2 independent filament and anode (with a grid output) thermoelectric batteries which are 14 equal symmetrically arranged bars of (8-10) x 92 x 24 mm clamped by means of screws to a hollow 14-hedral metal piece heated with a 20-line petroleum lamp "Молния" (Molniya). An alloy of 65% Sb and 35% Zn (with a small percentage of other admixtures) which can be heated up to 400°C serves as the positive arm of each element; the negative arm is constantan (40% Ni and 60% Cu) making up only 10% of the total weight of the element. The temperature of heated facets of the thermal units reaches 350-380°C, that of opposite ones contacting the cooled aluminum ribs reaches 70-80°C. Three units of the filament battery differ from

Thermoelectric Generator for Power Supply of Radio Receivers

11 anode batteries by a larger cross-section. Load characteristics for both batteries are given which enable one to judge on their suitability for the power supply of "Родина -52" ("Rodina-52"), "Нов" ("Nov"), "Искра" ("Iskra"), and others. Filament and anode units can be also used independently (for instance, in automatic control systems). The height of the heat generator with a supporting appliance is 1 m, the greatest diameter of the thermal head is 0.3 m, weight is 8 kg, service time > 6,000 hours, heating time is 15 min.

TITLE: A stochastic model of the motion of an object at sea

SOURCE: Morakoy sbornik, no. 12, 1965, 26-29

TOPIC TAGS: stochastic process, naval tactic, model theory

ABSTRACT: The problem of predicting the movement of enemy vessels at sea is discussed. Initial data are based upon observations of an enemy vessel for a limited period of time. Trajectories can be computed on the basis of random values for turn angles and the times on various courses. The application of the stochastic method in constructing a model for the zigzag movement of an object at sea is described. A detailed example of the formulation of the problem in ALGOL-60 language is given. Orig. art. has: 7 formulas.

TITLE: Indicatrix of scattering of polydisperse water clouds in the visible region of the spectrum

SOURCE: Mezhdvedomstvennoye sovestchaniye po aktinometrii i optike atmosfery. 5th.
 Moskva, 1967. Aktinometriya i optika atmosfery (Actinometry and Optics of the Atmosphere).
 Trudy soveshchaniya. Moscow, Izd-vo Nauka, 1964, 128-134

TOPIC TAGS: cloud, atmospheric physics, rainbow, scattering indicatrix, light scattering

ABSTRACT: The following formulas can be used for computing the indicatrix of scattering of a polydisperse cloud

$$X(\gamma) = \frac{\sum p_i (I_i(\gamma) + I_i(\gamma)) P_i(\gamma)}{\sum P_i(\gamma)}; \quad (1)$$

$$P_i(\gamma) = \frac{\sum n(a) a^3 S(\lambda) I(\lambda) e^{-\tau_i(\lambda)} e^{-\gamma_i(\lambda)}}{\sum S(\lambda) I(\lambda) e^{-\tau_i(\lambda)} e^{-\gamma_i(\lambda)}}. \quad (2)$$

Card 1/3

L 52755-65

ACCESSION NR: AT5011166

Here, $X(\gamma)$ is the normalized indicatrix for a polydisperse cloud; and γ is the angle of scattering (angle between the directions of the incident and scattered rays). The indicatrix is normalized if

$$\frac{1}{2} \int X(\gamma) \sin \gamma d\gamma = 1. \quad (3)$$

where $i_1(\gamma)$ and $i_2(\gamma)$ are the intensities of scattered radiation in two polarization planes, computed using the Mie formulas, $P(p)$ is the weight assigned to the indicatrix for each p , $S(\lambda)$ is the spectral sensitivity of the radiation detector, $I(\lambda)$ is the spectral intensity of solar radiation at the upper boundary of the atmosphere, $t_1(\lambda)$ is the spectral thickness of the layer above the cloud, and $t_2(\lambda)$ is the spectral thickness of the layer of the atmosphere between the sensor and the cloud. Formulas (1) and (2) were used to compute four indicatrices for polydisperse clouds. It was found that the indicatrices of polydisperse clouds are smoothed considerably in comparison with the indicatrices of individual drops. Maxima are retained in the region $\gamma = 140^\circ$ (rainbow) and $\gamma = 180^\circ$ (glory). A rainbow should be observed in all water clouds, and also a glory. There are no rainbows in ice clouds. Therefore, drop clouds can be distinguished from crystalline clouds on the basis of the presence or absence of a rainbow. From the position of the maxima of the rainbow or glory on a television or photographic picture it is possible to determine the type of cloud.

Card 2/3

L 52755-65

ACCESSION NR: AT5011166

of the television set or camera in space. The region of angles of scattering close to 180° is the most sensitive to change of drop size in a cloud, except for the region of small scattering angles. The effective size of drops in clouds can therefore be judged from observations of the brightness of clouds in the region of large scattering angles. With the exception of the region of small scattering angles, the indicatrices of water clouds of different micro-structure differ very little from one another. Therefore, a single common indicatrix can be used to solve a whole series of practical problems, especially computations of the angular distribution of scattered light at the upper boundary of a water-drop cloud, regardless of its form. (Fig. art. has: 6 formulas, 4 figures and 1 table.)

Artificial hibernation was induced in patients by administration of neuroleptic drugs (chlorpromazine, promethazine, etizin, fenethazine, promedol, procaine). This method was used in 52 patients for prophylaxis of surgical shock and in 12 for treatment of developing traumatic shock. Artificial hibernation is helpful in the prevention of surgical shock in major surgery. Blood transfusion followed by induction of hibernation gives a positive therapeutic effect in the treatment of traumatic shock of the II and III degrees.

plexes 44,55

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 6, no. 12, 1964, 2202

TOPIC TAGS: polymerization, butadiene, catalysis, macromolecular chemistry

Abstract: It was shown that the polymerisation of butadiene in benzene
solutions under the influence of catalytic systems based on pi-allylic
complexes of nickel and metal halides ($TiCl_4$, WC_4 , WC_2 , $AlBr_3$, and $NiCl_2$)
leads to the formation of a polymer with predominantly (up to 94%) cis-1,4-
units. The stereospecificity of these catalysts does not depend on the na-
ture of the metal in the Lewis acid. The polymerisation temperature was 30-
50° and the time 0-15 hours.

TITLE: Mechanism and kinetics of catalytic polymerization of isoprene

SOURCE: Vsesoyuznyy nauchno-issledovatel'skiy institut sinteticheskogo kauchuka. Polimerizatsiya izoprena kompleksnymi katalizatorami (Polymerization of isoprene by complex catalysts). Moscow, Izd-vo Khimiya, 1964, 14-40

TOPIC TAGS: isoprene polymerization, kinetics, mechanism, catalyst, catalysis

ABSTRACT: Effect of temperature and concentrations of monomer and catalyst on kinetics of isoprene polymerization in isopentane and on polymer molecular weight and microstructure was studied at 10°, 20°, and 30°C. $TiCl_3$ activated with $(-C_6H_5)_2AlCl$ served as catalyst. Experiments were also conducted without a solvent and in benzene solution. The initial rate of polymerization R_p (up to 25% conversion) is described by the equation:

$$R_p = \frac{a \cdot k_1 \cdot k_2 \cdot m_0^2}{k_3} \left(n_0 - \frac{1}{K} \right)$$

where: a is a proportionality coefficient, k_1 , k_2 , and k_3 are rate constants of
